According to a new leak, Apple may be preparing the iPhone 11 Pro as one of three phones in its lineup for the company's big launch Sept. On paper, this move makes sense, and it may help justify the premium for what could be the successor to the iPhone XS Max, which currently starts at \$1099. Although the iPhone XS Max is Tom's best smartphone guide right now, maybe a big 6.5-inch OLED screen and a large battery just isn't enough incentive for buyers to come up with a much cheaper 6.1-inch iPhone XR that costs just \$749, or from the \$999 5.8-inch iPhone XS.

Prime-day deals: See all the best deals right now! iPhone sales have fallen 12 percent in a year during the last quarter as people hold on to their phones longer than ever before. But the iPhone 11 Pro can shake things up. Wait, what's the point of the iPhone 11 Pro? Between the MacBook Pro and the iPad Pro, there are many precedents for Apple cutting out the Pro line for the iPhone. And there is a clear financial incentive for this. The 9.7-inch iPad, for example, starts at \$329, while the iPad Pro jumps all the way up to \$799 to start. The point of creating a Pro line is not to sell more phones, says Avi Greengart, a leading analyst at Techsponential, but to increase the average selling price (ASP) by better adapting the experience to different price points. The biggest of the iPhone 11 models in the works for the fall may be the iPhone 11 Pro. (Image credit: Marquis Brownlee) So what would the 6.5-inch iPhone 11 Pro have, that the usual iPhone 11 or iPhone 11 R wouldn't? Well, you can scratch 5G from the list because it's not expected until the iPhone 12 in 2020. But there are many other features that can be exclusive to the iPhone 11 Pro. That's what we could get. Here's a feature Apple can steal from the iPad Pro. Apple ProMotion technology automatically adjusts the speed of screen updates based on what you do to deliver a smoother experience. The iPad Pro has a top upgrade speed of 120Hz, so it's possible Apple can bring this technology to the iPhone 11 Pro as well. Other phones with 120Hz displays include Asus ROG Phone 2 and Razer Phone 2. The Screen OnePlus 7 Pro has a 90Hz upgrade speed, which we found also made a big difference in everyday use compared to the typical 60Hz smartphone screens. The Pixel 4 is also rumored to be moving towards a 90-Hz display. All rumors and leaks point to Apple keeping the Lightning connector on iPhones this year, but including zipping to a USB-C cable in the box for faster charging. Previously, to get a quick charge on your iPhone, you'd need to fork out \$49 for Apple's USB-C Charger (or pay for a cheaper charger) and another \$19 for a zipper to a USB-C cable. The Lightning port may stay this year, but Apple may turn on the Lightning cable to USB-C for quick charging. (Image credit: Tom) Maybe Apple will reserve USB-C charging for the iPhone 11 Pro. Or maybe you get a quick charging on 11R and iPhone 11 and even faster charging on the iPhone 11 Pro. We'll have to wait and see. Apple Pencil's support One sure way to differentiate the iPhone 11 Pro and other iPhone 11 devices adds support to Apple Pencil. And at least one analyst predicts that Apple Pencil is coming to the iPhone 11. But will Apple just let people use the existing Apple Pencil for the iPad Pro? Apple Pencil may not be just for iPads anymore. (Image credit: Apple) The new Apple Pencil has some neat features, such as the ability to change tools with a double-click, and magnetic design to attach to the iPad Pro. It also charges wirelessly when connected to the iPad Pro. But it's also a very large writing device compared to the 6.5-inch display, so I have to wonder whether Apple will pull the Galaxy Note 10 and find a way to integrate the stylus holster into the design. Since we haven't seen any rumors on this point, at this point I assume the iPhone 11 Pro will just work with the existing Apple Pencil. More advanced cameras Are coming on the iPhone 11. (Image credit: Digit India/@OnLeaks) Will Apple reserve this feature only for the iPhone Pro? A report published in The Wall Street Journal in January said that only the successor to the iPhone XS Max would receive triple cameras, so it's possible the 5.8-inch iPhone 11 will stick to the two cameras. Assuming that Apple clearly differentiates the iPhone 11 and iPhone 11 Pro, the company may decide to widen the price gap between the two phones. In fact, I wouldn't be surprised if the delta rises from \$100 currently to \$150 or \$200. But there is a big risk to make such a move. We are now actually forecasting year-on-year declines in iPhone sales in 2019, based on the assumption that we will see another (small) price increase compared to last year's flagship products, said Annette Tsimmermann, vice president and analyst at research firm Gartner. Apple, which has already lost market share in the world, as it is no longer the no-2 smartphone manufacturer in the world. The iPhone 11 Pro won't be about restoring that share though, but creating a new level of smartphone experience. And this segmentation may well pay off - if the performance is as good as marketing advertising. The registry key can be seen as a bit like a file folder, but it only exists in the Windows registry. Registry keys contain registry values, just as folders contain files. Registry keys may also contain other registry keys, which are sometimes referred to as subs. Registry keys work the same in all versions of Windows. There have been some changes in the way you roll up and expand the key registry, but they were very minor and did not affect their function. The Windows registry is structured in a hierarchy, and the top registry keys are called registry hives. They have special attached to them, but they registry keys in every other sense. The term registry entry can individual part of the Windows registry (such as a hive or value), but it's usually synonymous with a registry key. Items in the registry are structured this way: KEY (HIVE)-SUBKEY Let's look at a specific example from a registry editor to help explain how registry keys work: HKEY_LOCAL_MACHINE's As you can see, the way the registry is shown above is divided into three sections, each divided by a rollback: HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft Each section is a single registry key, with the right-most nested under one and so on. Thinking about it differently: Each key is under one left, just as the path on your computer works like C: The first registry key, HKEY_LOCAL_MACHINE, is at the top of the path and the registry hive. The nest under the HKEY_LOCAL_MACHINE is the key of the SOFTWARE registry. Microsoft Key is another registry key invested in software. Registry keys are not sensitive to the case, which means it doesn't matter if the letters are upper and lower registry; they can be written anyway without affecting how they work. Registry keys can be investigated quite deeply. Here's an example of a registry of key five depth levels that you'll find in the registry of any Windows computer according to the hive HKEY_CURRENT_CONFIG: HKEY_CURRENT_CONFIG\The System\CurrentControlSet\Control\Printers You can change how your Windows system functions at some very fundamental levels by adding, changing and deleting registry keys. However, you should take great care when tinkering with the registry because you can cause serious problems in your computer that can lead to the loss of all data. It is advisable to back up the registry before making any changes to it. With a copy of the keys that you change in your hand, you can feel safe knowing that you can undo any changes that may cause problems in your system. You don't need to back up all the registry if you don't want to; You can reserve time for the only registry keys you are running. Your backup registry keys exist as a REG file. You can easily back up registry keys by opening the REG file and following hints, and this can be done no matter what version of Windows you use. The big news (so far) at today's Apple event is the new MacBook Pro. And, as expected, the big news about the new MacBook Pro, which comes in the 13th and 15th versions, is its new Touch Bar. The Touch Bar is a retina resolution color display located where every other computer has key features for decades. This is an extremely sensitive context, showing everything from input offerings to playable controls to previewing photo filters, depending on what you're doing in which app. And you can even customize it by dragging With the main display on the bar. Phil Schiller of Apple started his work at Touch Bar with a requiem for functional keys that date back to decades of the era when people used terminals to access text-only mainframes. At first glance, I can't imagine who will be missed I'm curious to see whether the rest of the industry will imitate Apple's replacement.
